The latest data from the World Meteorological Organization shows the month of July "at least equaled if not surpassed the hottest month in recorded history" - and it followed the hottest June ever, UN Secretary General Antonio Guterres said Thursday.

The UN chief told reporters that "this is even more significant because the previous hottest month, July 2016, occurred during one of the strongest El Nino's ever," which was not the case this year. An El Nino is a natural warming of the ocean that once it interacts with the atmosphere often warms up the globe and changes rainfall and temperature patterns, making some places wetter and some places drier.

Guterres said the latest weather data, including temperature-shattering records from New Delhi and Anchorage to Paris, Santiago, Adelaide, Australia and the Arctic Circle, means the world is on track for the period from 2015 to 2019 "to be the five hottest years on record."

He warned that if all nations don't take immediate action to tackle climate change, extreme weather events happening now "are just the tip of the iceberg."

"And the iceberg is also rapidly melting," Guterres said.

Arctic Sea ice is already near record low levels, he said, and the European heat wave last month has raised temperatures in the Arctic and Greenland by 10 to 15 degrees Celsius.

"Preventing irreversible climate disruption is the race of our lives and for our lives," Guterres said. "It is a race we can - and must - win."

In his efforts to keep climate change at the top of the global agenda, the secretary-general has organized a Youth Climate Summit for Sept. 21, to be followed by a Climate Action Summit for world leaders on Sept. 23, the day before their annual gathering at the UN General Assembly.

Guterres said he looks forward to welcoming young leaders, including 16-year-old Swedish climate activist Greta Thunberg. He said he has told leaders from governments, business and civil society "that the ticket to entry is bold action and much greater ambition," not "beautiful speeches."

Guterres also said solar and onshore wind now the cheapest sources of new power in virtually all major economies.
